## **CF FAD CONSTRUCTION MIXER (8X4)**

# Always Working

- Lightweight vehicle chassis
- Excellent off-road capabilities
- Designed to boost productivity and comfort

The CF FAD Construction Mixer has been developed as a lightweight vehicle chassis specifically for 8 m<sup>3</sup> mixer bodies. Combined with the robust driveline, this delivers a high maximum payload as well as high uptime.

The chassis reinforcement of the CF FAD Construction Mixer ensures a smooth ride across the toughest of terrains. The tight turning circle ensures optimal vehicle usability, even in tight spaces. Add the robust reinforced bumper and high ground clearance and the CF FAD makes light work of anything it may encounter on the building site or throughout challenging road conditions.

#### CONSTRUCTION

Trucks that operate within the Construction and Industrial Waste segment are always working and often have complex bodies such as cranes, mixer drums, tippers or hooklifts, which means they are not easily replaced if they break down. That's why these vehicles are designed to be reliable and durable and can manoeuvre across surfaced roads, building sites and quarries. In short, they are always working to serve the challenging transport segment for the building industry, road-construction and surface mining.

### CONCRETE

#### **Setting the standards**

Concrete application vehicles are defined by mixer or concrete pump bodies. Both are highly specialised types of transport with specific requirements. The rigid chassis with a mixer drum is designed to carry 8, 9 or even up to 10 m³ of concrete. Whereas a tractor chassis can take trailers with a mixer drum for 10 - 12 m³ of concrete. DAF offers both rigid and tractor chassis, so there is always the perfect weight optimisation to ensure a high payload, without having to compromise on the water supply or the rigidity of the mixer body. Concrete pumps require a robust body attachment method and space on the chassis for their retractable, stabilizing legs. Furthermore, the right PTO and communication between truck and body must be available in order to operate both the body and the vehicle chassis safely and efficiently. DAF offers an optimised vehicle chassis, a wide range of PTOs, application connectors and vehicle-to-body communication options for an optimal concrete pump vehicle chassis!
